## Taiwan Earthquake: How Taipei 101 Survived?

- The island's tallest building 'Taipei 101', located in the capital city of Taipei, survived the 7.4 magnitude earthquake in Taiwan without much damage.
- America's 'CNN' media reported that the reason for this is the 'pendulum' specially set up in the middle of that phase.
- The pendulum consists of an iron sphere weighing 660 metric tons.
- The pendulum swings against the motions of an earthquake, limiting the building's sway by about 40 percent.
- It is because of this amazing technology that even in such a powerful earthquake, the 'Taipei 101' building did not suffer much damage, CNN reported.
