Meteorologists warning

- El Niño is a change in wind speed and direction from east to west in the Pacific Ocean.
- In the Pacific Ocean, there will be severe impacts if there is excessive heat in the equatorial regions.
- According to a report by meteorologists at the US National Oceanic and Atmospheric Administration's National Office, this climate event in the Pacific Ocean will increase global temperatures.
- And it has continued to increase in recent years as a result of climate change.
- As a result, the Earth's average temperature may rise by more than 1.5 degrees Celsius, according to scientists.
- The world has taken various measures to prevent the average temperature of the Earth from rising by 1.5 degrees Celsius.
